

# Navigating with Badges

Starting in March 2024, ezEML has incorporated colored “badges” that indicate all errors and warnings associated with the various sections and elements of an ezEML data package. These badges are clickable, showing lists of errors and warnings, and the errors and warnings they list are themselves clickable, taking you directly to the item that needs to be added or edited, scrolling it into view and highlighting it.

Red badges indicate that errors are present in a particular page or section, yellow badges indicate there are warnings only, and green badges indicate the absence of any errors or warnings. Your goal in editing an ezEML data package should be to enter all required and recommended metadata and make corrections until, at the minimum, no red badges remain. Even better would be to get rid of all warnings, as well, and thereby make all badges green.

This is highly dynamic functionality, so the easiest way to see how it works is probably to watch the YouTube video, [here](#). A textual description follows, however.

Let’s suppose we have loaded two data tables from CSV files. Both are newly loaded, so they have some missing metadata values, such as column definitions, units for numerical variables, etc. Since they have errors, they are displayed with red badges.

## Data Tables ?

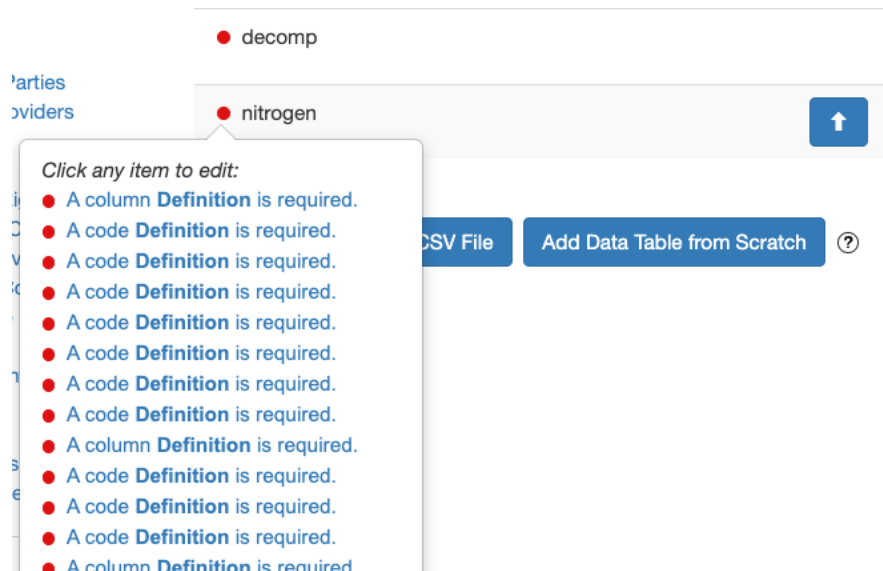

Data Table Name				
<span>●</span> decomp		Edit	Remove	Re-upload <span>?</span>
<span>●</span> nitrogen		Edit	Remove	Re-upload

Load Data Table from CSV File

Add Data Table from Scratch ?

Save and Continue

If I hover over a table’s badge, a list of errors/warnings drops down. These are all the errors/warnings for the given table.

I can click any of the errors/warnings to be taken to the page where the item needs to be entered or edited.

Alternatively, if I go to the **Edit Column Properties** page for the table, I will see all of its columns listed, each with its own badge. So, in the example below, several columns have been corrected and are now green, but there are still some red badges remaining.

## Columns of *nitrogen*

Col #	Column Name	Type <sup>?</sup>		
1	<span>●</span> YEAR	DateTime	Edit Properties	Change Type
2	<span>●</span> NTRT	Categorical	Edit Properties	Change Type
3	<span>●</span> ARM	Categorical	Edit Properties	Change Type
4	<span>●</span> NET_PRIMARY_PRODUCTION	Numerical	Edit Properties	Change Type
5	<span>●</span> STEM_MASS_DENSITY	Numerical	Edit Properties	Change Type

Suppose I hover over the badge for column STEM\_MASS\_DENSITY. The resulting drop-down list shows the errors/warnings for just that one column.

Click for errors/warnings

5	STEM_MASS_DENSITY	Numerical
		Numerical
	TRATION	Numerical
8	N_ASSIMILATED	Numerical

Click any item to edit:

- A column **Definition** is required.
- A Numerical variable is required to have a **Standard Unit** or **Custom Unit** defined.

Suppose I click on the first error, “A column **Definition** is required.” This takes me to the page where the entry needs to be entered, highlights the entry, and scrolls it into view.

## • Numerical Column

Save Changes ?

Column: STEM\_MASS\_DENSITY Data Table: nitrogen

Name \*

STEM\_MASS\_DENSITY ?

Definition \*

?

Label (Optional)

STEM\_MASS\_DENSITY ?

Suppose now I fill in the entry, as shown below. The natural thing to do is to go back up to the badge now and get the next error/warning. There is a problem in so doing, however. The change that you have just entered hasn’t been saved yet.

## • Numerical Column

Save Changes ?

Column: STEM\_MASS\_DENSITY Data Table: nitrogen

Name \*

STEM\_MASS\_DENSITY ?

Definition \*

Mass density for stem ?

Label (Optional)

STEM\_MASS\_DENSITY ?

Let's say you go ahead and click the badge without saving. Then you are shown a dialog box that tells you that you have unsaved changes. It explains that you need to click the **Save Changes** button after making a change, before opening the errors/warnings list again.

The screenshot shows a web form titled "Numerical Column". At the top right is a "Save Changes" button. Below the title, it says "Column: STEM\_MASS\_DENSITY" and "Data Table: nitrogen". There are input fields for "Name \*" (containing "STEM\_MASS\_DENSITY") and "Definition \*" (containing "Mass"). A white dialog box with a close button (X) is overlaid on the form. The dialog box has the title "Unsaved Changes" and contains the following text: "You have unsaved changes. Click the **Save Changes** button to save them before selecting an item from the Errors/Warnings list. Otherwise, your changes will be lost." and "In the future, when using the Errors/Warnings list to navigate, you can avoid this popup message by clicking the **Save Changes** button to save each new change before clicking on the colored badge to open the Errors/Warnings list."

Close the dialog and click **Save Changes**. After this happens a few times, you will get into the habit and clicking **Save Changes** without being prompted. After saving changes, you can go back to the errors/warnings list to get the next item. You will see that the error for the missing column definition is no longer in the list since the definition has been entered.

The screenshot shows the "Numerical Column" form again. The "Definition \*" field now contains "Mass density for stem". A red dot icon is visible next to the title. A tooltip is displayed over the red dot, containing the text: "Click any item to edit:" followed by a red dot and the text "A Numerical variable is required to have a **Standard Unit** or **Custom Unit** defined."

Click the next error. This takes you to where the unit has to be entered, highlights the entry for **Standard Unit**, and scrolls it into view. You actually have the choice of entering a standard unit or a custom unit. ezEML needs to choose one to highlight, and it highlights the standard unit, but you are free to enter either one. The highlighting is intended just to draw your attention to where you need to take action.

Enter a standard unit value or a custom unit value: \*

<b>Standard Unit</b> <input type="text"/>	<b>Custom Unit</b> <input type="text"/> <b>Description (Recommended)</b> <input type="text"/>
--	--

Now if we pick a standard unit and **Save Changes**, we will have completed the errors/warnings for this column, so the column's badge will turn green.

## • Numerical Column

Save Changes

Column: STEM\_MASS\_DENSITY

Data Table: nitrogen

Name \*

STEM\_MASS\_DENSITY

Definition \*

Mass density for stem

Label (Optional)

STEM\_MASS\_DENSITY

Enter a standard unit value or a custom unit value: \*

<b>Standard Unit</b> <input type="text" value="gramPerCentimeterCubed"/>	<b>Custom Unit</b> <input type="text"/> <b>Description (Recommended)</b> <input type="text"/>
---	--

And likewise, the **Edit Column Properties** page now shows a green badge for STEM\_MASS\_DENSITY.

## Columns of *nitrogen*

Col #	Column Name	Type <sup>?</sup>		
1	● YEAR	DateTime	Edit Properties	Change Type
2	● NTRT	Categorical	Edit Properties	Change Type
3	● ARM	Categorical	Edit Properties	Change Type
4	● NET_PRIMARY_PRODUCTION	Numerical	Edit Properties	Change Type
5	● STEM_MASS_DENSITY	Numerical	Edit Properties	Change Type

Continuing in this way, we can use the badges' errors/warnings drop-down lists to take us to items needing our attention until we've gotten rid of all of the red/yellow badges.

The badges associated with the **Contents** list behave a little differently.

### Contents <sup>?</sup>

- Title
- **Data Tables**
- Creators
- Contacts
- Associated Parties
- Metadata Providers
- Abstract
- Keywords
- Intellectual Rights
- Geographic Coverage
- Temporal Coverage
- Taxonomic Coverage
- Maintenance

If, for example, you click the badge for **Data Tables**, you are taken to the **Check Metadata** page, with the section for data tables highlighted:

## Data Tables

### Data Table: decomp

Item	Issue
Column Definition	● A column <b>Definition</b> is required.
Code Definition	● A code <b>Definition</b> is required.
Code Definition	● A code <b>Definition</b> is required.
Column Definition	● A column <b>Definition</b> is required.
Column Definition	● A column <b>Definition</b> is required.
Code Definition	● A code <b>Definition</b> is required.
Code Definition	● A code <b>Definition</b> is required.
Code Definition	● A code <b>Definition</b> is required.
Column Definition	● A column <b>Definition</b> is required.
Code Definition	● A code <b>Definition</b> is required.
Code Definition	● A code <b>Definition</b> is required.
Code Definition	● A code <b>Definition</b> is required.
Code Definition	● A code <b>Definition</b> is required.
Code Definition	● A code <b>Definition</b> is required.
Code Definition	● A code <b>Definition</b> is required.
Column Definition	● A column <b>Definition</b> is required.
Column Definition	● A column <b>Definition</b> is required.
Explanation	● A Missing Value Code <b>Explanation</b> is required.
Numerical Variable Unit	● A Numerical variable is required to have a <b>Standard Unit</b> or <b>Custom Unit</b> defined.
Description	● A data table <b>Description</b> is highly recommended.

### Data Table: nitrogen

Item	Issue
Column Definition	● A column <b>Definition</b> is required.

etc.

This lets you see all the errors/warnings for data tables, all at once.

To some extent, the badges supersede the **Check Metadata** page. There is at least one scenario where **Check Metadata** remains especially useful, however. If you fetch a package from the EDI repository with the intent to update it, for example, you may see a number of yellow badges, and you'd like to see what the issues are without going to each of the badges, one at a time. By going to the **Check Metadata** page, you can see them all at once:
